# Introduction

The determinant  $\det$  is function that outputs a scalar from an input  $n \times n$  matrix  $A$  with following properties.

1.  $\det(I) = 1$
2.  $\det(A) = 0$  if 2 columns are equal
3.  $|\dots \lambda_1 \mathbf{a}_1 + \lambda_2 \mathbf{a}_2 \dots| = \lambda_1 |\dots \mathbf{a}_1 \dots| + \lambda_2 |\dots \mathbf{a}_2 \dots|$

It has been proven only one function has these properties

# Properties of the Determinant

1.  $\begin{vmatrix} \dots & \mathbf{0} & \dots \end{vmatrix} = 0$
2.  $\begin{vmatrix} \dots & \mathbf{a_i} & \dots & \mathbf{a_j} & \dots \end{vmatrix} = - \begin{vmatrix} \dots & \mathbf{a_j} & \dots & \mathbf{a_i} & \dots \end{vmatrix}$
3.  $\begin{vmatrix} \dots & \mathbf{a_i} & \dots & \mathbf{a_j} & \dots \end{vmatrix} = - \begin{vmatrix} \dots & \mathbf{a_i + \lambda a_j} & \dots & \mathbf{a_j} & \dots \end{vmatrix}$
4.  $\det(A) = \det(A^T)$
5.  $\det(AB) = \det(A)\det(B)$
6.  $\det(A^{-1}) = (\det(A))^{-1}$

# Permutations

1. A perm of elements is bijection from the set  $\{1,2,\dots,n\}$  to itself

4.  $N$  choose  $k$  ways to choose an inversion of some size

2. A transposition is where only 2 elements positions are changed

5. Inversions can be odd or even based on the number of inversions

3. The permutation  $\sigma$ 's inverse is the inverse function  $\sigma^{-1}$

# Determinants

# Determinants with a Transposition Matrix

A matrix's determinant does not change under transposition.

$$\det(\mathbf{A}) = \det(\mathbf{A}^T)$$

**Example:**

$$\det(A) = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$\det(A) = (1 * 4) - (2 * 3)$$

$$\det(A^T) = \begin{bmatrix} 1 & 3 \\ 2 & 4 \end{bmatrix}$$

$$\det(A^T) = (1 * 4) - (3 * 2)$$

# Determinants of a Product of Matrices

A matrix product's determinant is the product of corresponding determinants.

$$\det(\mathbf{AB}) = \det(\mathbf{A}) \det(\mathbf{B})$$

# Determinants of an Inverse Matrix

The determinant of the *inverse of a matrix* is the same as the inverse of the determinant

$$\det(A^{-1}) = \frac{1}{\det(A)}$$

Below, the area of the parallelogram is the determinant of the matrix. The bigger  $\det(\mathbf{A})$  gets, the smaller the inverse gets (and vice versa).

# Matrix Inverse

## Requirements for a Matrix to have an inverse

1. Is the Matrix a Square?
  - a. If so, continue.
2. Is the determinant of the matrix,  $\det(a)=0$ 
  - a. If  $\det(a) = 0$ , there is no inverse
  - b. If  $\det(a) \neq 0$ , then there is an inverse

$$\mathbf{Ax} = \mathbf{y} \iff \mathbf{Ax} = \mathbf{Iy}$$

$$\mathbf{A}^{-1}\mathbf{Ax} = \mathbf{A}^{-1}\mathbf{Iy} \iff \mathbf{Ix} = \mathbf{A}^{-1}\mathbf{y}$$
